• prototype?

a prototype would be comprised of basic functionality only, in public user context, in admin context, having an identical UX except with optionally shown/hidden features, primarily placed in the roll-out — hamburger — menu^[1].

it would also have the "map component", an interactive element that, beside persisting drag & drop instructions it gets from admin-context, will have its own context submenu included within main hamburger menu^[1].

how to implement all this without complicating the prototype?
